1/1 answered

Q1 MOCK INTERVIEW

100 marks

- 1.What is the difference between an array and a variable?
2. What is meant by the base address of an array?
- 3.What happens if an array size is not specified during initialization?
4. How are 2D arrays stored in memory?
5. Give one real-life application of multidimensional arrays.
- 6.Why do arrays start from index 0 instead of 1?
- 7.Which engineering fields commonly use multidimensional arrays?
- 8.Can a multidimensional array have more than three dimensions?
- 9.Why are images stored as multidimensional arrays?
10. What is row-major order?
11. Does C use row-major or column-major order?
12. Why can't arrays return multiple values?
13. What happens when array bounds are exceeded?
14. Why are strings stored as character arrays?
15. Explain the difference between `char str[]` and `char *str`.
16. Can two-dimensional arrays be passed to functions?
17. When would a linked list outperform an array?
18. Differentiate `gets()`, `fgets()`, `scanf()`, and `getchar()`.

Your Answer

1. Difference between an array and a variable: A variable stores a single value of a given data type, whereas an array is a collection of multiple values of the same data type stored under one name, accessed using an index.
